

Phase	GenAI Tool Used	Validation Method
Plan and domain brainstorming	ChatGPT	Used ChatGPT to brainstorm about what our domains and plan is going to be. This was done in multiple iterations. Domains, datasets and the architectural suggestions were checked manually, refined in multiple iterations
Implementation	Claude Code	Used Claude Code to implement the repository structure and the architectures. It was done in multiple iterations, which corresponded roughly to implementing one architecture. The code was thoroughly reviewed manually after each iteration.
Logging + log analysis	Claude Code	Used Claude Code to apply logging to the runners, so we could see the exact prompt, thinking, and reply exchanges between agents. We also used Claude Code as a tool to analyze these logs when errors surfaced. Validity was checked by manually inspecting the raw logs.
Plot generation	Claude Code	Used Claude Code to create a script for aggregating the results from a csv file, and one to create performance + cost plots in PNG. The code and the plots' numbers were manually checked.
Report	Claude + Gemini	Used Claude and Gemini models to write comprehensive report about the project, based on our findings. The report was refined in many iterations, thoroughly read through and manually edited at the end.
Code review	Claude Code	Used Claude Code to deepen the understanding of the generated files. The goal was to understand each line of code.
